Ali Amanat Ali *Software Engineer*

aliamanatali218@gmail.com | Lahore, Pakistan | in/aliamanatali | aliamanatali

PROFILE

Full-stack software engineer with 3+ years of experience building and scaling web products with Next.js, React, TypeScript, Node.js and Python (FastAPI). Strong track record in frontend performance, payments and billing systems, real-time features, security hardening and AWS deployment, with measurable impact on page speed, API latency and revenue flows.

PROFESSIONAL EXPERIENCE

Software Engineer 09/2025 – Present | United States (Remote)
Remotebase

SnapDev Marketplace & Platform API:

- **A marketplace where founders book hourly sessions with vetted engineers**, built with a Next.js 16 frontend, FastAPI and MongoDB backend, Google and email auth on Supabase, Cal.com scheduling, Chatwoot-based chat, Stripe hour plans and top-ups, GitHub repository access for engineers, and PostHog, GA4 and Meta analytics.
- **Cut landing-page JavaScript by 394 KB** by removing a single import chain, and moved the **480 KB PostHog SDK** (68% of per-page JS) off the critical path, reaching a **Lighthouse score of 97 with 1.0s LCP**.
- **Dropped auth-check latency from 366–796 ms to under 1 ms** by verifying Supabase JWTs locally instead of calling Supabase on every request, and **cut repeat authenticated requests by 46%** with short-lived identity caching.
- **Built real-time chat over Server-Sent Events**, taking new-message latency from **15 s to ~1 s**, with server-rendered transcripts, threaded replies and attachments.
- **Closed the critical findings from the October 2026 penetration test**, including a cross-tenant hole that let any customer read, post into and resolve another customer's support conversations; a GitHub endpoint that let any user grant admin access on any company-administered repository; and a forgeable OAuth state, replaced with a single-use server-side nonce. Added security headers, login CSRF guards, per-route auth rate limits and Gitleaks, Semgrep and Trivy scanning on every PR.
- **Rebuilt the hours billing** so purchased hours survive renewals and plan changes, webhooks retry safely and no endpoint grants unpaid credit; billing suite grew to **145 tests**.
- **Made a backend test suite runnable for the first time** (44 of 76 modules previously failed to import) and grew it to **2,154 passing tests**; added a **Playwright end-to-end suite** for auth, booking, chat and Stripe payments.

Ember AI Web Builder & VS Code Extension:

- **Built the Ember AI web builder**, a platform that generates full frontend applications from a prompt or PRD, runs them in isolated Vercel sandboxes, syncs them to GitHub and deploys them through Render.
- **Owned usage and cost tracking end to end**, with per-request cost calculated from model-specific pricing in the VS Code extension, synced to the server so credits stay consistent across devices, with optimised polling and a credit dashboard in the web app; then gated every credit-spending path so no generation runs unpaid.
- **Designed a recoverable two-hop GitHub repository transfer** so generated apps are handed to customers despite GitHub refusing org-to-user transfers; half-finished transfers resume from GitHub's own state.

SnapDev Deployment Portal:

- **Built the portal** in Next.js 15, TypeScript, Tailwind v4, Radix UI and TanStack Query, with Drizzle ORM on PostgreSQL and a nonce-based CSP.
- **Engineered a deployment layer on the Render API** that lets users create services from GitHub or Ember-generated repositories and manage them in one place: trigger deploys, follow live status and deploy history, stream logs, edit environment variables, attach and verify custom domains, and share or transfer service ownership.
- **Deployed it to AWS ECS Fargate with Terraform**, with separate staging and production stacks, ECR, ALB routing, ACM certificates, SSM-backed secrets and GitHub Actions CI/CD on ARM runners.

Associate Software Engineer 06/2024 – 11/2025 | Lahore, Pakistan
Devsinc

PetsVivo Project:

- **A pet-management platform for apartment communities and hotels**, built with a React and TypeScript frontend with RTK Query, Stripe payments, Pusher real-time updates and a multi-role back office for residents,

managers, brokers and admins.

- **Architected role-based access control for 7 roles** (SuperAdmin, Space Manager, Building Manager, Leasing Manager, Broker, Resident, Applicant) with per-role route guards, module-level gating, a role switcher and admin "masquerade as manager".
- **Built the multi-step pet application flow** covering pet and assistance-animal profiles, vaccination documents, attestation templates, criteria evaluation, unit assignment and application termination.
- **Migrated the data layer to RTK Query**, cutting data-fetching boilerplate by **40%** and improving API performance by **30%**.
- **Wired pet fees and pending payments through Stripe**, and instrumented the app with Mixpanel, GA4, Customer.io and Datadog RUM.
- **Added manager tooling** for incident reports, CSV unit upload, resident and pet directories, notifications, pricing and fee settings and real-time status updates.
- **Set up Vitest with React Testing Library and a CI test step**, i18n with react-i18next, direct S3 uploads with progress bars, and Cloudflare Turnstile on public forms.

BlendedSense Project :

- **A marketplace that connects businesses with vetted photographers and videographers**, built with a React frontend with Clerk auth, AWS S3 and CloudFront media storage on RDS.
- **Engineered the media pipeline** with presigned S3 uploads so the browser never holds storage credentials, and user-keyed storage that improved retrieval efficiency by **40%**; CloudFront delivery cut load times by up to **50%**.
- **Moved authentication to Clerk**, reducing database response time by **25%**.

SKILLS

Frontend: React.js (Hooks, Redux Toolkit, RTK Query), Next.js, TypeScript, HTML5/CSS3, Tailwind CSS, Bootstrap, Formik, Yup

Backend: Python, FastAPI, Node.js, Express.js, Celery, RESTful API design, Server-Sent Events, Socket.io

Databases & Caching: MongoDB, PostgreSQL, MySQL, Redis

Cloud & DevOps: AWS (ECS Fargate, S3, CloudFront, RDS, ElastiCache, SSM), Terraform, Docker, GitHub Actions, Render, Vercel

Testing & Quality: Playwright, Vitest, React Testing Library, pytest, Lighthouse, bundle budgets

Payments, Auth & Analytics: Stripe, Supabase Auth, Clerk, Cal.com, Chatwoot, PostHog, GA4, Meta Conversions API, Klaviyo, Resend

AI & Others: OpenAI API, Gemini API, LLM tool-calling workflows, VS Code Extension API, Git/GitHub

EDUCATION

Bachelors in Computer Science (BSCS) 2020 – 2024 | Lahore, Pakistan

Punjab University College of Information and Technology (PUCIT) | **CGPA: 3.1**

PROJECTS

Valiance Financial Underwriting – AI Document Analysis

- **An AI underwriting assistant for an investment firm**. Brokers submit deal packages as PDFs, Excel sheets, scanned images and handwritten records, and the system turns them into structured financial reports and investment insights. Next.js frontend, Python backend with Celery and Redis, OpenAI and Gemini.
- Cut LLM API costs by ~80% by classifying documents from a few selected pages instead of the full file; a Celery and Redis pipeline chunks 100+ page PDFs across parallel workers and streams progress to the browser over SSE.
- Built a human-in-the-loop review step where analysts verify each extracted figure against its source, correct handwritten values, resolve duplicates and regenerate the report, producing more accurate reports and a regulatory audit trail; an OpenAI/Gemini chatbot answers questions grounded in the report.

Face Match – Event Photo Retrieval

- **A photo-retrieval app for event organisers and photography agencies**. Attendees upload a selfie and receive every photo they appear in, without browsing other guests' photos. React and Tailwind frontend, Node.js backend, Face API.js.
- Face API.js generates facial descriptors in the browser and a Node.js backend matches them against the library; cut manual photo searching by ~90% across large event sets.
